

## Miniature SPI Digital Barometer

The MPL115A1 is an absolute pressure sensor with digital output for low cost applications. A miniature 5 x 3 x 1.2 mm LGA package ideally suits it for portable electronics and space constrained applications. Low current consumptions of 5  $\mu$ A during Active mode and 1  $\mu$ A during Shutdown (Sleep) mode target battery and other low-power applications. A wide operating temperature range from -40°C to +105°C fits demanding environmental requirements.

MPL115A1 employs a MEMS pressure sensor with a conditioning IC to provide accurate pressure measurement from 50 to 115 kPa. An integrated ADC provides digitized temperature and pressure sensor outputs via a SPI port. Calibration Data is stored in internal ROM. Utilizing raw sensor output, the host microcontroller executes a compensation algorithm to render *Compensated Absolute Pressure* with 1 kPa accuracy.

The MPL115A1 pressure sensor's small form factor, low power capability, precision, and digital output optimize it for barometric measurement applications.

## Compensation

The pressure compensation for MPL115A1 is based on a 2-dimensional, second order polynomial based on Microsystems mst\_trimlib library.

The 10-bit compensated pressure output,  $P_{comp}$ , is calculated as follows:

$$P_{comp} = a_0 + (b_1 + c_{11} * P_{adc} + c_{12} * T_{adc}) * P_{adc} + (b_2 + c_{22} * T_{adc}) * T_{adc}$$

Where:

- $P_{adc}$  is the 10-bit pressure output of the MPL115A1 ADC,
- $T_{adc}$  is the 10-bit temperature output of the MPL115A1 ADC,
- $a_0$  is the pressure offset coefficient,
- $b_1$  is the pressure sensitivity coefficient,
- $c_{11}$  is the pressure linearity (2nd order) coefficient,
- $c_{12}$  is the coefficient for temperature sensitivity coefficient (TCS),
- $b_2$  is the 1st order temperature offset coefficient (TCO),
- $c_{22}$  is the 2nd order temperature offset coefficient.

Ideally,  $P_{comp}$  will produce a value of 0 with an input pressure of 50 kPa and will produce a full-scale value of 1023 with an input pressure of 115 kPa.

## Coefficient Bit-Width Specs

The table below specifies the initial coefficient bit-width specs for the compensation algorithm.

10-bit Output: Compensation Coefficient Specs							Total Coeff. Bits
	a0	b1	b2	c12	c11	c22	
<b>Total Bits</b>	16	16	16	14	11	11	84

<b>dec pt zero pad</b>	—	—	—	9	11	15	

Example Binary Format Definitions:

1. Sign = 0, Integer Bits = 8, Fractional Bits = 4 :                      Coeff = S I<sub>7</sub> I<sub>6</sub> I<sub>5</sub> I<sub>4</sub> I<sub>3</sub> I<sub>2</sub> I<sub>1</sub> I<sub>0</sub> . F<sub>3</sub> F<sub>2</sub> F<sub>1</sub> F<sub>0</sub>

## Coefficient Address Map

Address	Coefficient
\$04	a0 MS Byte
\$05	a0 LS Byte
\$06	b1 MS Byte
\$07	b1 LS Byte
\$08	b2 MS Byte
\$09	b2 LS Byte

\$0F	c22 LS Byte

For coefficients with less than 16 bits, the lower lsbs are zero. For example, c11 is 11 bits and is stored into 2 bytes as follows:

$$c11 \text{ MS byte} = c11[10:3] = [c11_{b10}, c11_{b9}, c11_{b8}, c11_{b7}, c11_{b6}, c11_{b5}, c11_{b4}, c11_{b3}]$$

**NOTE:** c11 LS byte = c11[2:0] & "00000" = [c11<sub>b2</sub>, c11<sub>b1</sub>, c11<sub>b0</sub>, 0, 0, 0, 0, 0]

## Solder Recommendations

1. Use SAC solder alloy (i.e., Sn-Ag-Cu) with a melting point of about 217°C. It is recommended to use SAC305 (i.e., Sn-3.0 wt.% Ag-0.5 wt.% Cu).
2. Reflow
  - Ramp up rate: 2 to 3 C/s.
  - Preheat flat (soak): 110 to 130s.
  - Reflow peak temperature: 250°C to 260°C (depends on exact SAC alloy composition).
  - Time above 217°C: 40 to 90s (depends on board type, thermal mass of the board/quantities in the reflow).
  - Ramp down: 5 to 6 C/s.
  - Using an inert reflow environment (with O<sub>2</sub> level about 5 to 15 ppm).

**NOTE:** The stress level and signal offset of the device also depends on the board type, board core material, board thickness and metal finishing of the board.

## Handling Recommendations

It is recommended to handle the MPL115A Pressure Sensor with a vacuum pick and place tool. Sharp objects utilized to move the MPL115A Pressure Sensor increase the possibility of damage via a foreign object/tool into the small exposed port.

The sensor die is sensitive to light exposure. Direct light exposure through the port hole can lead to varied accuracy of pressure measurement. Avoid such exposure to the port during normal operation.
