MH-ET LIVE Scanner v3.0

QR code barcode recognition module
scan code module
serial communication UART interface embedded

Content

Chapter 1 Getting Started

Introduction

The product adopts a professional image processing chip for barcode recognition, which can maintain high-speed performance of fast and stable reading in a complex environment, and has the characteristics of low power consumption and low heat generation. Quick start, cold start and warm start can keep up the rapid start, no need to wait, it is ready to open.
Supports reading 1D and 2D codes on paper, screen, plastic and other carriers.

About this manual

This manual mainly provides various function setting instructions for the product. By scanning the setup function bar code in this manual, you can change function parameters such as communication interface parameters, read operation mode, prompt mode, data processing and output.

Chapter 2 System Settings

Restore factory defaults

Note: Please use the “Restore Factory Default” function carefully. After reading this setting code, the current parameter setting will be lost and replaced with the factory default value. The factory default parameters and functions can be found in Appendix A.

~MA5F01B2C.
Reset

User default setting

In addition to the factory default settings, you can save frequently used settings to the user default settings.
Reading the "Save User Defaults" code will save all parameters of the QR code scanner to the user default settings. If there is user default configuration information on the QR code scanner, the current configuration information will replace the original user default configuration information after this operation.
Reading "Restore User Defaults" will cause the engine to switch to the state of the user's default settings.
Note: The previously saved user default settings are not lost when the factory defaults are restored.

~MA5F0506A.

~MA5F08F37.

Save user default recovery user default

Use setup code

Reading the "Scan Code Configuration Function Settings: On" barcode allows the QR code scan engine to enable the function of configuring a specific barcode (setting code function). After the function is turned on, parameters can be modified for the QR code scanning engine by reading one or more setting codes. After the setting is completed, you need to read "Save User Default" to save it, then read "Scan Code Configuration Function Setting: Off" to close the setting code and enter the normal scanning mode.
After reading "Scan Code Configuration Function Setting: Off", the QR code scanning engine can only read and process the "Scan Code Configuration Function Setting: On" setting code.

setting : Off

Chapter 3 Communication Interface

The Scanner v3.0 QR code scanner provides USB or TTL-232 communication with the host. Through the communication interface, it can receive read data, control the output of the QR code scanner, and change the function of the QR code scanner. Can parameters, etc.

Serial communication interface

The serial communication interface is a common way to connect a QR code scanner to a host device. When using the serial communication interface, the QR code scanner and the host device must be completely matched in the communication parameter configuration to ensure smooth communication and correct content.

The serial communication interface usually provided by the QR code scanner is based on TTL level signals, which is directly applied to the special model.
RS-232 conversion circuit.

The form of TTL3.3V can be connected to most application architectures. For some systems that need to use RS-232 interface mode, level conversion must be performed. .

The default serial communication parameters of the QR code scanner are as follows. When they are inconsistent with the host device, they can be modified by reading the setup code.

Parameter	Default
Serial communication type	Standard TTL3.3V
Baud Rate	9600
Parity Type	None
Data Bits	8
Stop Bits	1
Hardware Flow Control	None

Baud rate

The Baud Rate is in bits per second (bps: bits per second). The optional configuration parameters are listed below.

~M00F50000.
1200 2400

~M00F50001.

~M00F50002.
4800 9600

~M00F50003.

~M00F50004.
19200 38400

~M00F50005.

~M00F50006.
57600 115200

~M00F50007.

USB interface

Connect the device interface (MiniUSB interface) of the USB cable to the BT100; connect the host interface (USB interface) of the USB cable to the host. This mode is USB HID KEYBOARD mode.

Chapter 4 Reading Mode

Continuous mode

Continuous mode: automatically starts decoding after power-on. After successful or failed decoding, it will automatically start the next decoding after waiting for a period of time.

Continuous mode

~M00210001.

Induction mode

Sensing mode: When the device detects that a bar code appears in the window range, it triggers a decoding.

~M00210002.

Induction mode night vision function

~M00260001.

Induction mode night vision function: on

~M00260000.

Induction mode night vision function: off

Command mode

Command mode: After sending the start decoding command after power-on, the device starts to continue decoding until the stop decoding command is received

~M00210003.

Command continuous mode sleep setting - turn on sleep

~M00220001.

Command continuous mode sleep setting - turn off sleep

~M00220000.

~M00240001.

Horizontal mirroring - off

~M00240000.

Vertical mirroring - on

~M00250001.

Vertical mirroring - off

~M00250000.

Same code identification delay setting

In the non-manual mode, the “same reading delay” setting device automatically starts the next reading after one reading. If the barcode is exactly the same as the last successfully read barcode, the reading engine will continue. Waiting state, until the same reading delay is over, the decoding can be successfully completed. When the barcode is not repeated, the reading device will always read the code.

~M00B00000.

No delay, delay, 100mSec

~M00B00001.

~M00B0000A.

Delay 1Sec delay 10Sec

~M00B00064.

Single reading time setting:

~M00B10000.

Single reading time setting: no delay

~M00B10032.

Single reading time setting: 5 seconds

Reading interval setting

~M00B20000.

Reading interval setting: no delay

~M00B2000A.

Reading interval setting: 1 second

Sensing mode sensitivity setting

Level0 is high, level1 is medium, and level2 is low

Sensing mode: Sensitivity level 0

Sensing mode: Sensitivity level 1

Induction mode: sensitivity level 2

Chapter 5 Instruction Mode

In different application scenarios, there will be different requirements. Scanner v3.0 has specially designed the instruction setting mode, which realizes the function that can be set by means of instructions and can be set by scanning code. The format of the instruction is as follows:

Command type	Command content	Description
Setting parameters	~Mxxxxyyyy.	M: setting ; xxxx: command; yyyy: value
Set response	[ACK]	Set successfully
	[NAK]	Valid command, invalid value
	[ENQ]	Invalid command
Query parameter	~Qxxxx.	Q: query; xxxx: command;
Query response	xxxxyyyy[ACK]	Xxxx: command; yyyy: numeric
	[ENQ]	Invalid command Invalid command
Trigger scan code	~T.	T: Trigger scan code
Trigger response	T[ACK]	Trigger success
	T[NAK]	Trigger failure

Chapter 6 Lighting

Lighting

The Scanner v3.0 is equipped with four positive white LEDs to provide an auxiliary illumination source. Even in a completely dark environment,
The barcode is quickly identified by the auxiliary illumination of the product. The lighting function can be switched on or off, and the brightness level can be adjusted by setting.

Normal mode: The lighting group lights up during shooting and goes out at other times.
Sensing mode: The lighting group lights up after the QR code scanner is turned on, and goes out at other times. Constant light mode: The lighting group continues to emit light after the QR code scanner is turned on.
Off: The light group does not illuminate under any circumstances.
